Faculty Member: Fabio Santos

The Team

Seth Borkovec: Team Lead, Client Communications, Coder

Noah Baxter: Team Architect, Editor, Coder

Ethan Donnelly: Team Recorder, Release Manager, Coder

Courtney Richmond: Research Manager, Website Manager, Coder

Why This Project Is Important

- Over 65 million Americans age 60+ (~20%)
- 23 million (35%) of these have at least one disability
- 1000's of AT (Assistive Technologies) devices

How will people age safely in their homes when they don't have a means of discovering these products?

Institute for Human Development

Kelly Roberts, Ph.D., Executive Director

Jill Pleasant, MA, OTR/L Associate Director

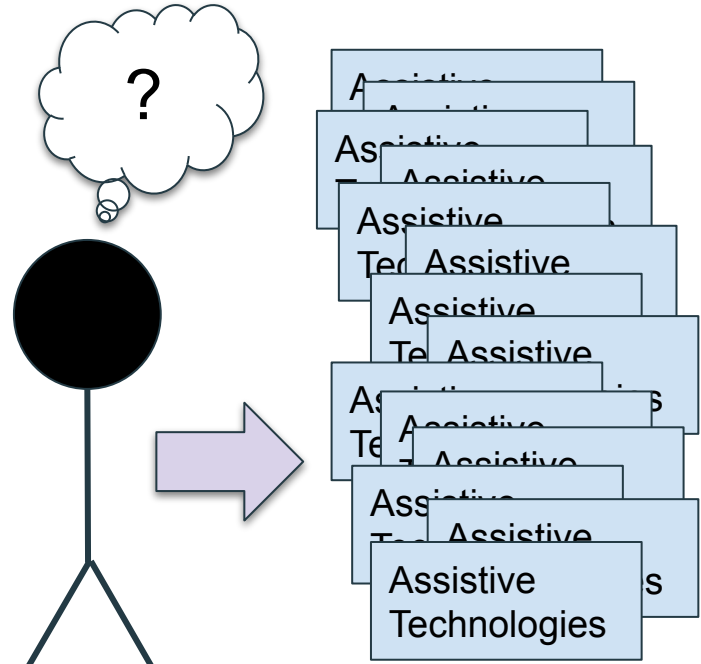

Mission:

- Enable people with disabilities
- Promote full inclusion
- Enhance lives

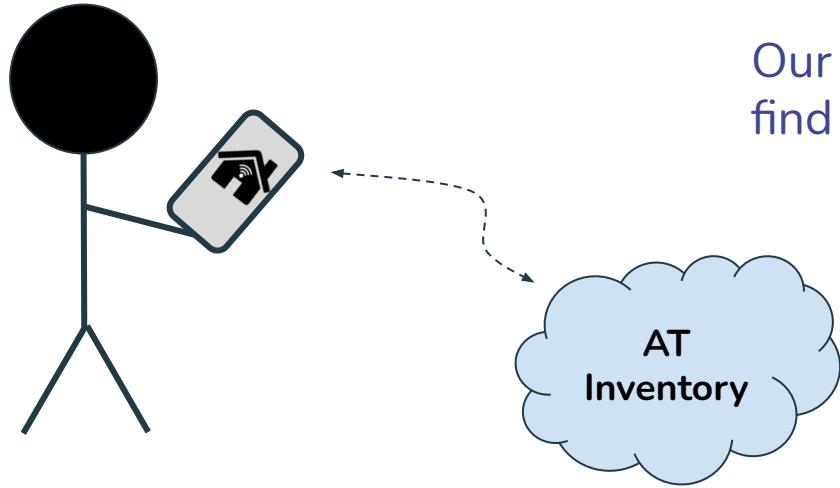

Problem

- So many assistive technologies exist
- Often a user needs a meeting with a real person
- Potential users are unaware

Solution Overview

Our solution is a mobile app to help people find AT (assistive technologies)

- Cross-platform mobile app (Android and iOS)
- Tailored AT recommendations to each user
- Central inventory of AT devices

Users will be happy to find the assistive technologies for their situation.

Implementation Overview

Requirements Acquisition:

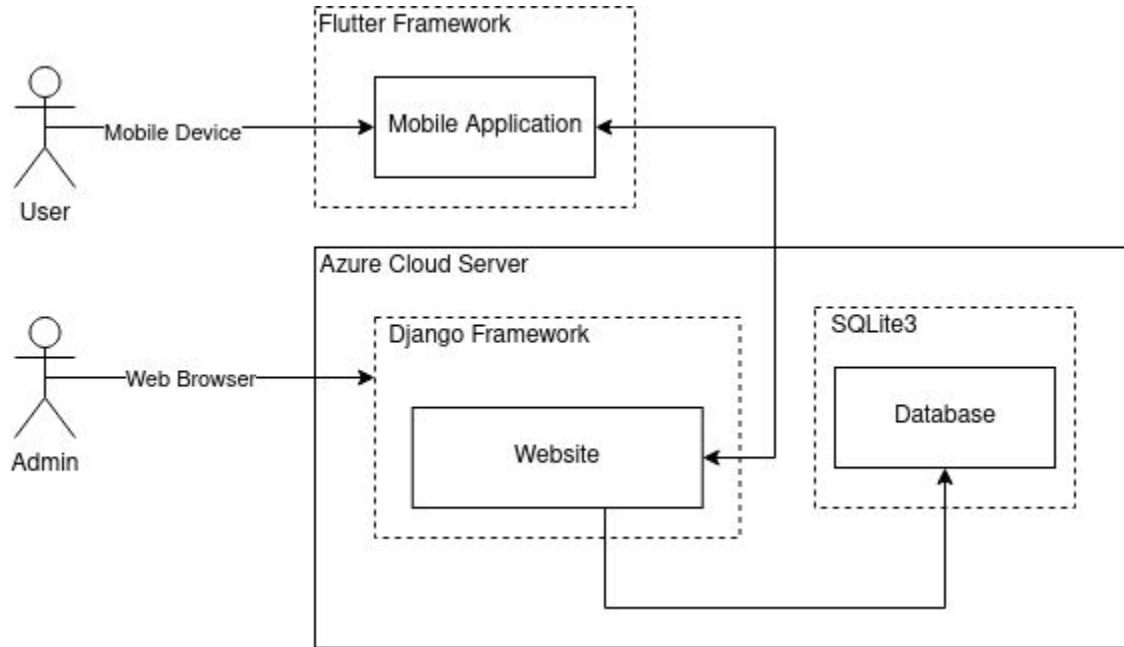

- Weekly meetings with our clients in the Fall Semester
- Research
- Documents

Implementation Overview

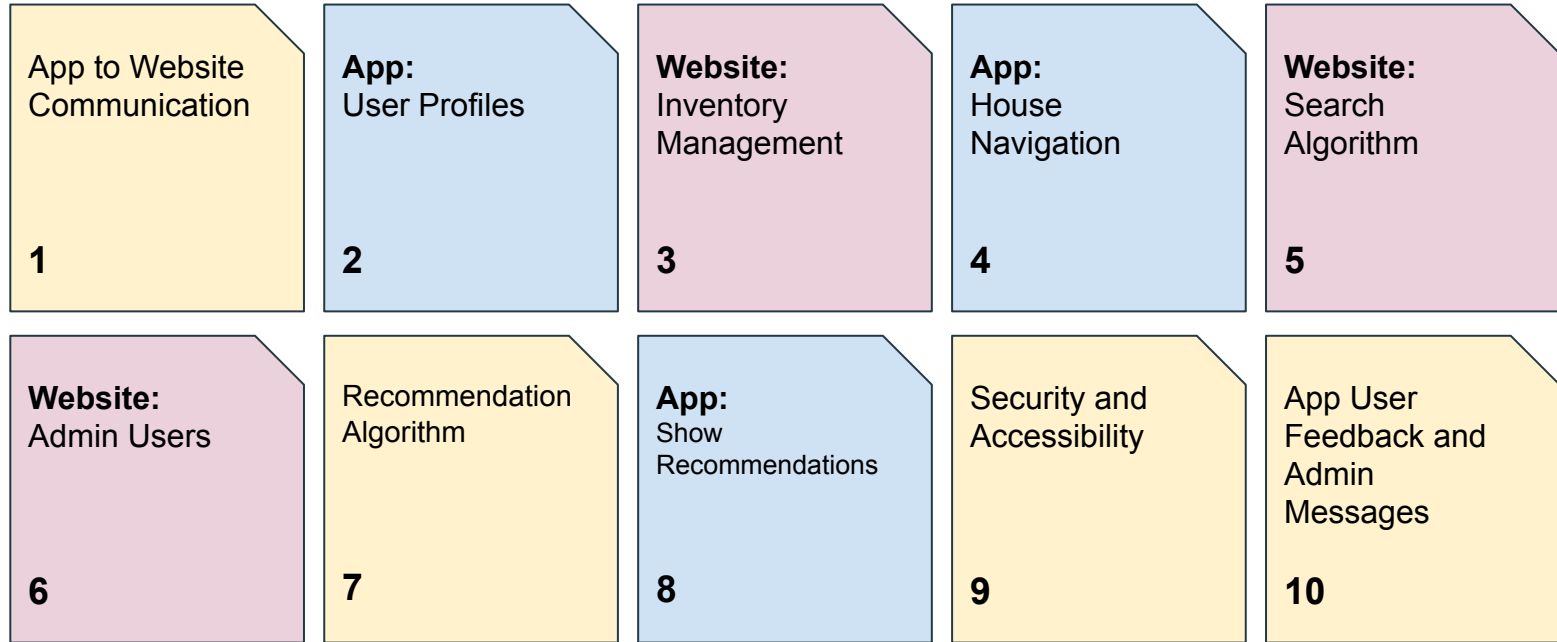

Key Requirements:

- User needs to be able to provide their general functional limitations
- User needs to be able to identify difficult areas in their home
- User information (limitations, profile) needs to be stored
- Application needs to be accessible
 - I.e., color blind mode, text-to-speech
- Application needs to recommend AT for the home area and user limitations
- Admins need to be able to add, remove, and edit information from a database

Architecture Overview

Implementation Review: Completed Modules

Prototype Review

(live demonstration)

Challenges

- Sharing Recommendations
- State resource handling
- Accessibility options

Challenge:

Sharing AT recommendations

Resolution:

- App can generate a pre formatted email with relevant information
- App can generate a HTML webpage that can be used to print

Challenge:

How to handle storing the state resources in the database

Resolution:

Maintain links to Catada site listing information for each state

Challenge:

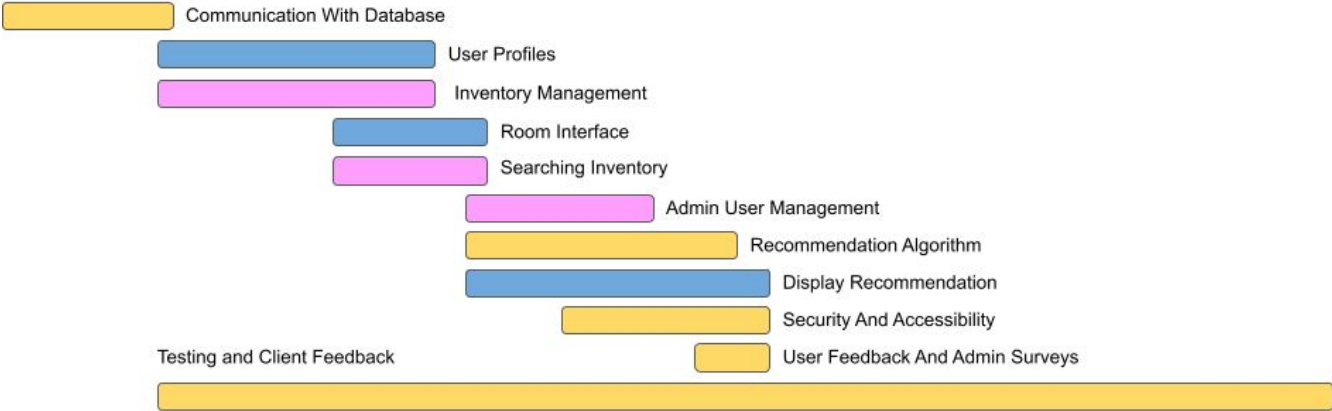

There are not libraries for accessibility options such as text to speech and speech to text

Resolution:

Use the Mobile phones built in features to provide this functionality

Schedule

Today

	Mobile App
	Website
	Mobile App and Website

- Non-functional Requirements 
- Bug Fixes 
- UI Refinements 

Testing Plan: Continuous Testing

Usability Testing:

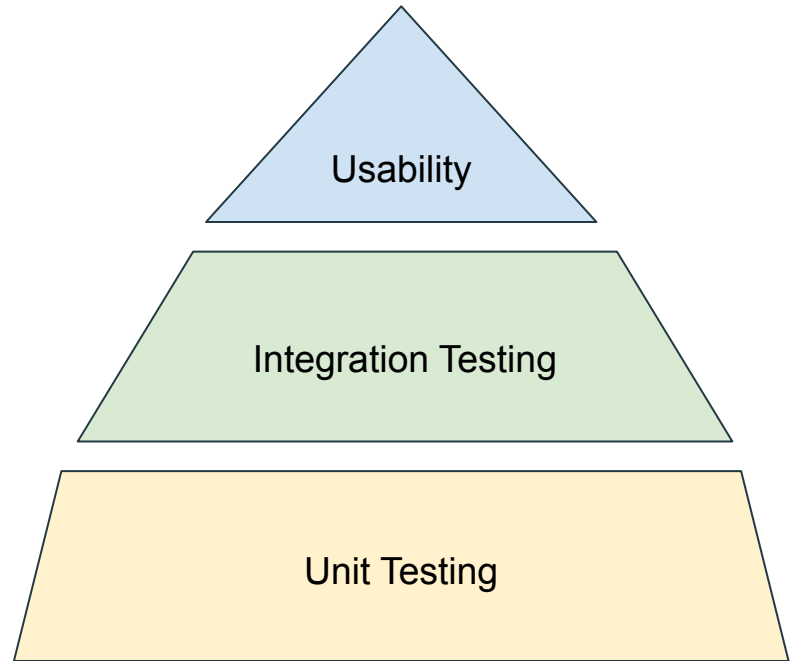

- Using the system

Integration Testing:

- Interactions among units

Unit Testing:

- Groups of functions with similar behavior

Usability Testing

End user testing:

- Have users perform tasks using app with limited guidance
- Observe what tasks caused users issues or took significant time

Website admin testing:

- Continuously give our clients update
- Clients gave constant feedback, we adjusted based on their comments

Conclusion

- There is currently no efficient means of connecting people with the proper AT
- We will create an mobile app that will pair individuals with the AT they need
- Key topics:
 - Implementation
 - Architecture
 - Challenges with Resolutions
