#### **Portable Sanitization Chamber**

**Project Proposal** 

Robertson Beauchamp, Jacob Blackburn, Lauren Kieffer, Elliot Nation, Angel Soto, Dangxian Zha

December 11, 2013

## Overview

- Client
- Objectives & Constraints
- Project Plan
- Concepts
- Engineering Analysis
- Final Design

### Client

- W.L. Gore & Associates, Inc.
- International Company
- Medical, fabrics, and other products
- Local office in Flagstaff, AZ
- Looking to prepare incoming engineers by sponsoring real-world application projects.

#### **Need Statement**

- The client currently has access to sterilization systems that use either harsh chemicals, or a large amount of heat that can damage various materials.
- The client needs a current sanitization device that is portable and safe for various materials such as plastics and papers.

#### Goal

 Develop a portable sanitization process that disinfects bioburden amounts past acceptable levels and is safe for various materials.

## Objectives

- Sanitizes within regulation bioburden levels
- Chemical exposure and residue within regulated concentration
- Materials sanitized retain functionality
- Sanitization system characterizes portability
- Cost to produce is comparatively inexpensive
- Quick sanitization cycle time

## **Design Specifications**

Design Specifications	Quantity or Pass/Fail
Process effectively elimiantes bacterial spores (e.g. Bacillus Atropheaus)	1 log unit reduction
Physical components do not cause user harm	pass/Fail
Chemical concentration	H <sub>2</sub> O <sub>2</sub> : 1.4 mg/m <sup>3</sup> No eye exposure to light
Electrically grounded Non-pinching hinge	pass/fail
Duration of process	20 minutes
Control System	pass/fail

Design Specifications	Quantity or Pass/Fail
Weight	35 kg
Footprint Area	$1 \text{ m}^2$
Temperature	120°C
Stresses applied	2 Gpa
Does not saturate material	pass/fail
Substance covers every aspect of material	pass/fail
Cost to generate design prototype	\$3,000

## **Operating Environment**

- Sanitize test strips contaminated with *Bacillus atrophaeus* used to evaluate bioburden level reduction
- Hydrogen peroxide test strips placed within chamber proximity to monitor exposure levels

Jacob Blackburn

## House of Quality

Jacob Blackburn

#### Autoclave

- Hot water sanitization
- Above 135 °C for at least 3 minutes
- Too hot for certain materials
- Water would deteriorate certain materials

#### **Electron Beam**

- Sanitizes through items
- Expensive
- Large scale

## **Laser Sanitization**

- Works with many materials
- Long cycle time
- Expensive

## **Infrared Radiation**

- Advantages:
  - Low cycle time
  - Compact
  - Minimum maintenance
  - Ease of use

- Disadvantages:
  - Cost to produce
  - Power required
  - Material incompatibility

## **Chemical Processes**

- Chemicals can kill 99% of bacteria
- Dry fog chemical sanitization
- Hydrogen Peroxide  $(H_2O_2)$  is a safe chemical
- Entire rooms can be cleaned in 15-30 minutes

## **Chemical Fogging**

Courtesy of http://www.gotfog.com

Lauren Kieffer

## Hydrogen Peroxide Fogging

Lauren Kieffer

# **Chemical Fogging**

- 7% hydrogen peroxide solution
- Cold vapor is safe for materials sensitive to heat and water
- Filters must be used to break down  $H_2O_2$

## **Material Selection**

- Must be compatible with  $H_2O_2$  at various concentrations.
- Aluminum, PVC and PTFE No negative reactions
- Aluminum used for enclosure, door, handles, hinges, etc.
- PVC and PTFE used in fogging components, tubing and nozzle.

## **Ultraviolet Light**

- Maximum kill potential 2-15 minutes
- Cost efficient
- Only sanitizes outer surface
- Bulbs must be regularly cleaned

#### **Ultraviolet Germicidal Irradiation**

		Lamp	UV-C			
	Life	Wattage	Radiation	Length	Diameter	
Bulb Model	(hr)	(W)	(W)	(cm)	(cm)	Weight (g)
TUV PL-L 95W	9000	95	27	53.5	3.8/1.8	134
TUV 18W ISL	9000	18	4.5	60.4	2.8	100

Weights	29%	24%	14%	19%	10%	5%	

# **Combined UV/H<sub>2</sub>O<sub>2</sub> Process**

- Eliminates need for filter
- Creates free hydroxyl radicals, OH-, that are strong oxidizing agents.
- Radicals degrade additional toxins.
- Study shown this process inactivates Bacillus atrophaeus spores.

# UV/H<sub>2</sub>O<sub>2</sub> Process

#### **The UV-Oxidation Process**

- UV converts hydrogen peroxide into highly reactive hydroxyl radicals.
- The hydroxyl radicals attack and decompose contaminants.
- 3. At the same time, UV light disinfects

Courtesy of: www.trojanuv.com

## **Material Selection**

- Aluminum used for enclosure.
- PVC and PTFE used in fogging device.
- Borosilicate glass used in between enclosure and UV lights.
- High UV transmittance, protects bulbs from fog and dust.

## **Final Design**

 Drawing highlights key dimensions

 Portability is achieved

## **Final Design Model**

#### **3D** Representation

#### **Component View**

#### **Mass Calculation**

Parts	QTY	Unit Mass(kg)	Total Mass(kg)
Chamber	1	17.64	17.64
Rack	1	7.85	7.85
UV Lights	4	0.13	0.54
Lampholder	4	0.05	0.18
Ballast	4	0.45	1.82
Fog Machine	1	0.14	0.14
Misc. /Hardware	1	2.27	2.27
		Total mass(kg)	30.43

#### Cost

Type of Cost	Cost (\$)
Bill of Material	1153.92
Manufacturing	190
Subtotal	1343.92
Man Power	22895
Total	24238.92

### Conclusion

 The combined UV/H<sub>2</sub>O<sub>2</sub> process achieves design specifications by reducing bioburden levels past a certain threshold.
