# ***PROJECT SCOPE***

This project consists of the design, manufacturing, and testing of a launch vehicle enclosure for Orbital ATK.

The primary purpose of the enclosure is to provide launch vehicles protection from the elements during launch pad processing.

# PROJECT REQUIREMENTS

- ▶ 19 customer needs developed by design team & client
- ▶ Highest valued client needs:
  - ▶ Launch Vehicle Contact
  - ▶ Accessibility
  - ▶ Safety/Component Safety Factors
  - ▶ Solar, Moisture, Wind Protection

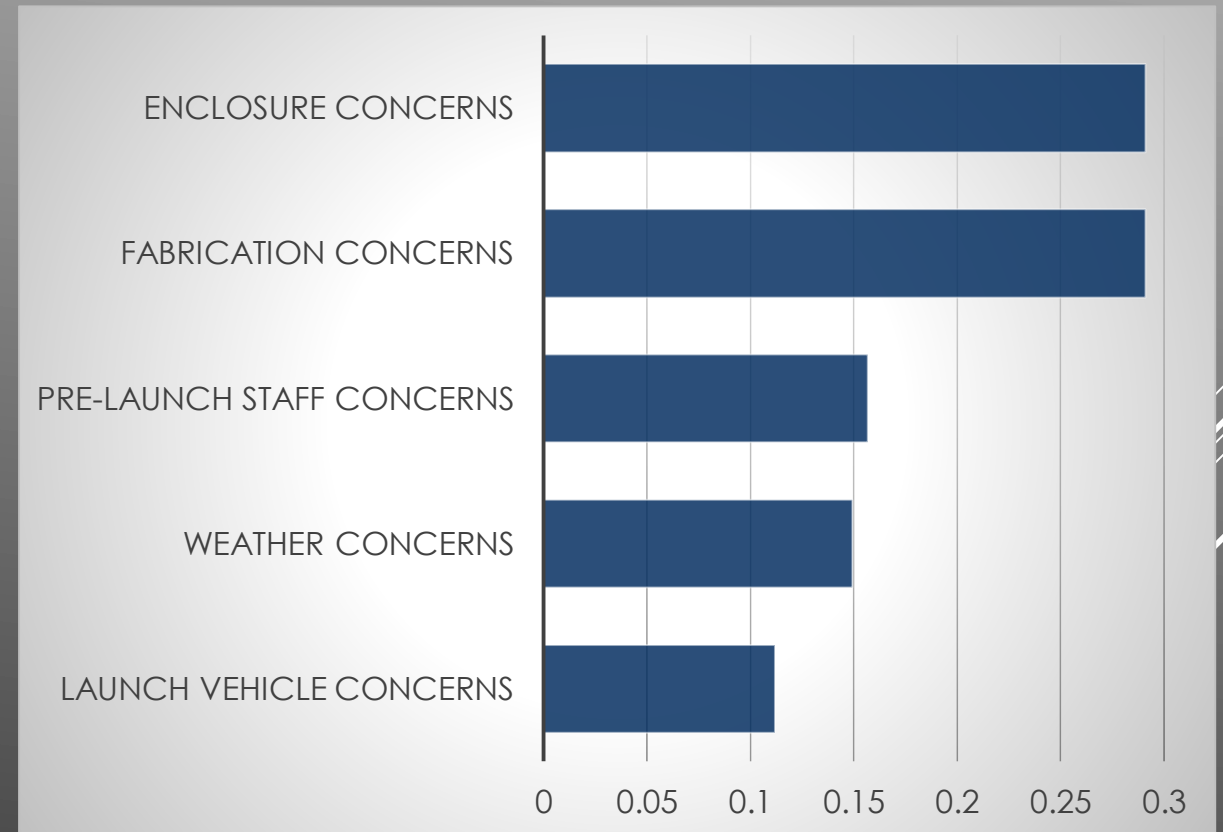

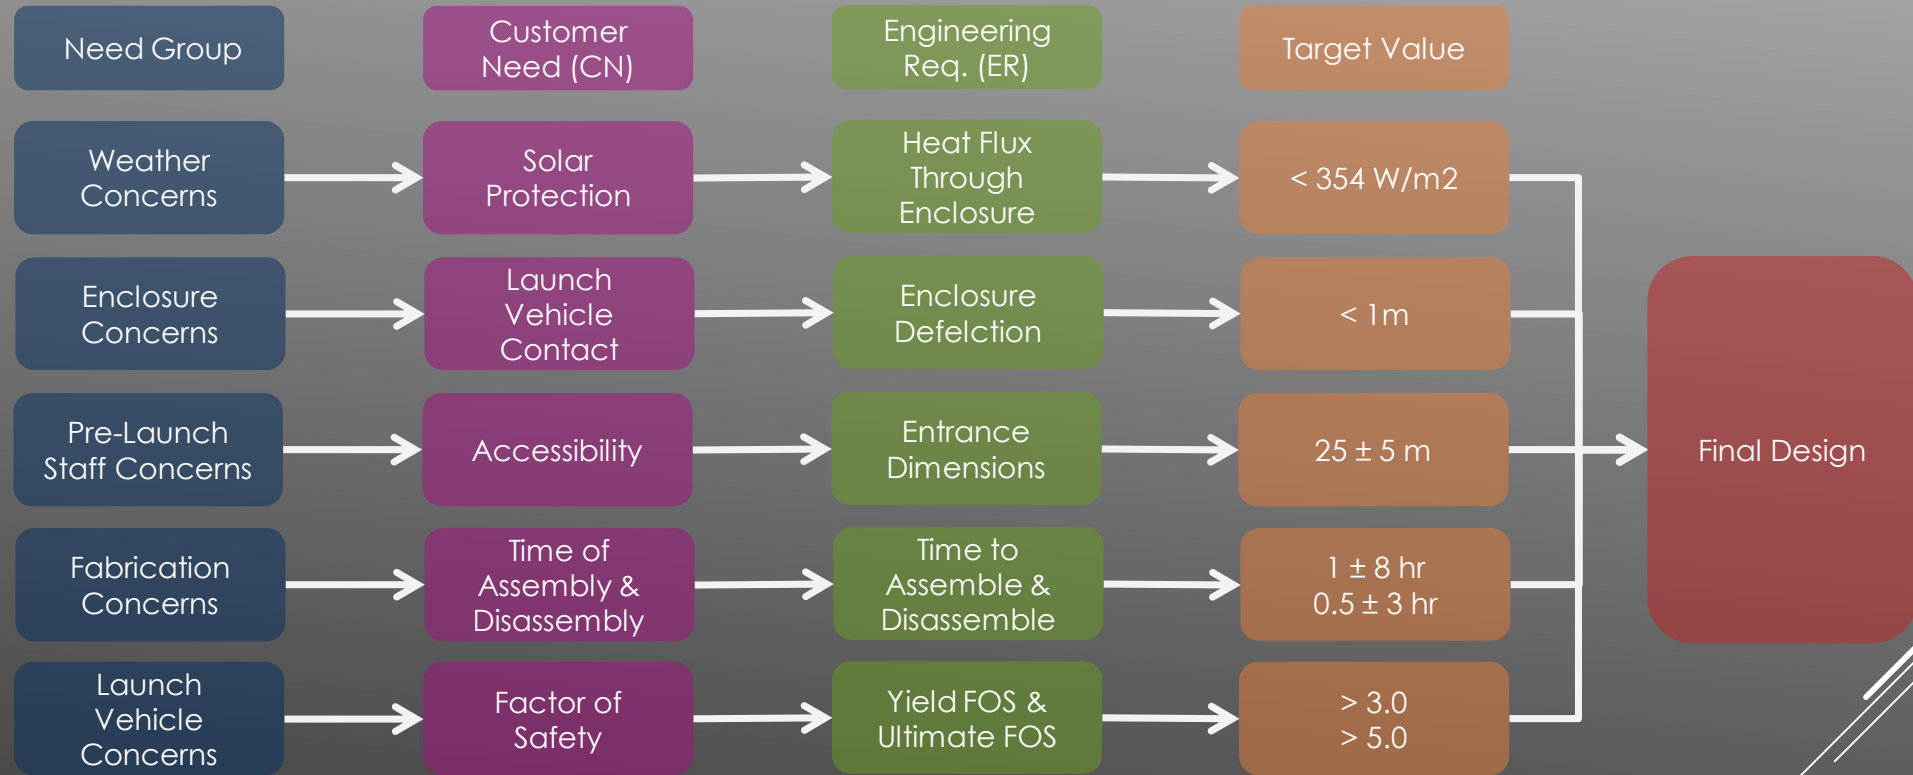

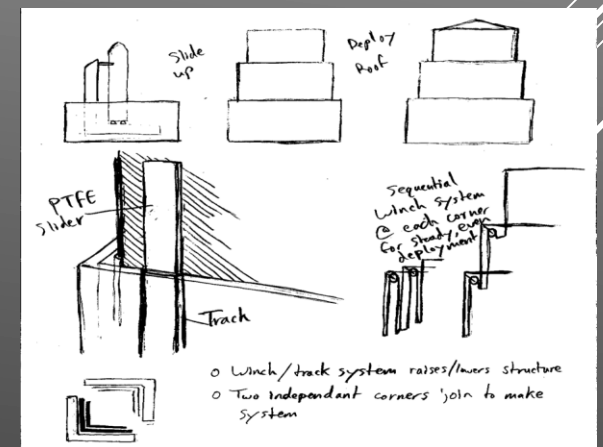

Figure 1. Weighted average of customer need groups

# PROJECT REQUIREMENTS

# EARLY DESIGN GENERATION

- ▶ Current solutions were researched for this design problem
- ▶ 10 preliminary design concepts developed
  - ▶ Each concept had multiple variations
- ▶ Untraditional solution preferred by client
- ▶ Feasibility was questionable for multiple designs

Figures 2-5. Preliminary concept sketches

# DESIGN SELECTION

Table 1. Quantitative design selection method

|                         |                 | Design: The Curtain |                | Design: The Bear Trap |                | Design: The Cone |                | Design: Rocket Awning |                |
|-------------------------|-----------------|---------------------|----------------|-----------------------|----------------|------------------|----------------|-----------------------|----------------|

# DESIGN ACCEPTANCE

- ▶ Preliminary & critical design reviews with Orbital ATK
- ▶ The Bear Trap concept was highly favored by Orbital ATK & design team
  - ▶ This design focused on rapid deployment and lightweight materials
- ▶ Features of 3 preliminary designs incorporated
- ▶ Approval for use of carbon fiber was provided

Figures 6-8. CAD images of proposed design selection

# DESIGN ANALYSES

- ▶ Analyses conducted:
  - ▶ Deflection
  - ▶ Degradation
  - ▶ Flexural Strength
  - ▶ Heat Transfer
  - ▶ Permeability
  - ▶ Stresses (FOS)
  - ▶ Wind Loads (Two approaches taken)
- ▶ Used in material selection & component design
- ▶ Each analysis conducted analytically
  - ▶ Testing verified results

Figure 9. RISA 3D model used to predict experienced stresses

# MANUFACTURING

- ▶ Steel:
  - ▶ Laser Cut – Valley Steel Supply
  - ▶ MIG Welding
  - ▶ Drill Press
- ▶ Carbon Fiber:
  - ▶ Miter Saw
- ▶ HDPE
  - ▶ Sewing Machine
- ▶ Connections:
  - ▶ Couplers
  - ▶ Fasteners
  - ▶ Epoxy
  - ▶ Compression Fittings

Figures 10-12. Major components of selected design which required additional fabrication

# ***SUB-SCALE PROTOTYPE***

Figures 13-16. Major components of launch vehicle enclosure for the 1/6<sup>th</sup> scale prototype

# ***SUB-SCALE PROTOTYPE***

Figures 17-18. Final 1/6<sup>th</sup> scale prototype in undeveloped & deployed positions, respectively

# TESTING

- ▶ 9 physical tests conducted
  - ▶ 6 supported analysis
  - ▶ 2 were inconclusive
  - ▶ 1 did not support analysis data
- ▶ Wind Load
  - ▶ Design team did not anticipate testing this ER
  - ▶ Withstood 50 mph gusts, meeting CN
  - ▶ April 12, 2018: Wind gusts recorded over 60 mph in testing area [1]

# TESTING RESULTS

Table 2. Results of 9 physical tests performed on launch vehicle enclosure

| Testing Conducted   | Engineering Requirement(s)                  | Procedure   | Results  | Target                                 |
|---------------------|---|---|--|--|
| Accessibility       | Footprint; Entrance Dimensions              | Measure Enclosure Opening                                 | 208.85 m <sup>2</sup> *; 286.92 m <sup>2</sup> * | 200 m <sup>2</sup> ; 25 m <sup>2</sup> |
| Assembly            | Assembly/Disassembly time; Assembly steps   | Time Design Team During Assembly/Disassembly              | 3 hr*; 2hr*; 7                                   | 8 hr; 3.5 hr; 10                       |
| Cost Analysis       | Cost Per Height                             | Record All Material Costs                                 | \$923/m  | \$2000/m                               |
| Flow Visualization  | Airflow Through Structure; Ventilation      | Force Smoke Through System                                | Inconclusive                                     | 0.071 m <sup>3</sup> /s                |
| Material Endurance  | Usage Quantities; Life Span                 | Fully Assemble/Disassemble Repeatedly                     | 7  | 5                                      |
| Operational Testing | Component Functionality                     | Assemble/Disassemble While Visually Inspecting Components | Fully functional                                 | N/A                                    |
| Permeability        | Flow Rate Through Material                  | Bucket/Timer Method On A Sample Piece of Fabric           | 212,000 g/m <sup>2</sup> /24hr**                 | 603g/m <sup>2</sup> /24hr              |
| Temperature Effects | Workspace Temperature; Vehicle Temperature; | Record Temperature Data From System                       | ~80°F  | 65.1 – 84.9°F                          |
| Three Point Bend    | Strength; Stress; FOS                       | Hydraulic Ram With Force Readings                         | ~1.11 Msi***                                     | 57 Msi                                 |

\*Testing result has been scaled to full scale enclosure

\*\*\* Failure occurred due to hydraulic ram puncture

\*\*Specified HDPE material could not be acquired

# CLOSING REMARKS

- ▶ Next Steps:
  - ▶ Continued material testing using specified manufacturers
  - ▶ Further development of seal between system halves
- ▶ Takeaways:
  - ▶ Importance of iterating
  - ▶ Communication
  - ▶ Scheduling
  - ▶ Gaps between theoretical analysis & physical testing
- ▶ Final Delivery to Orbital ATK
  - ▶ May 3, 2018

Figure 21. Final 1/6<sup>th</sup> CAD model for launch vehicle enclosure

# PERMEABILITY ANALYSIS

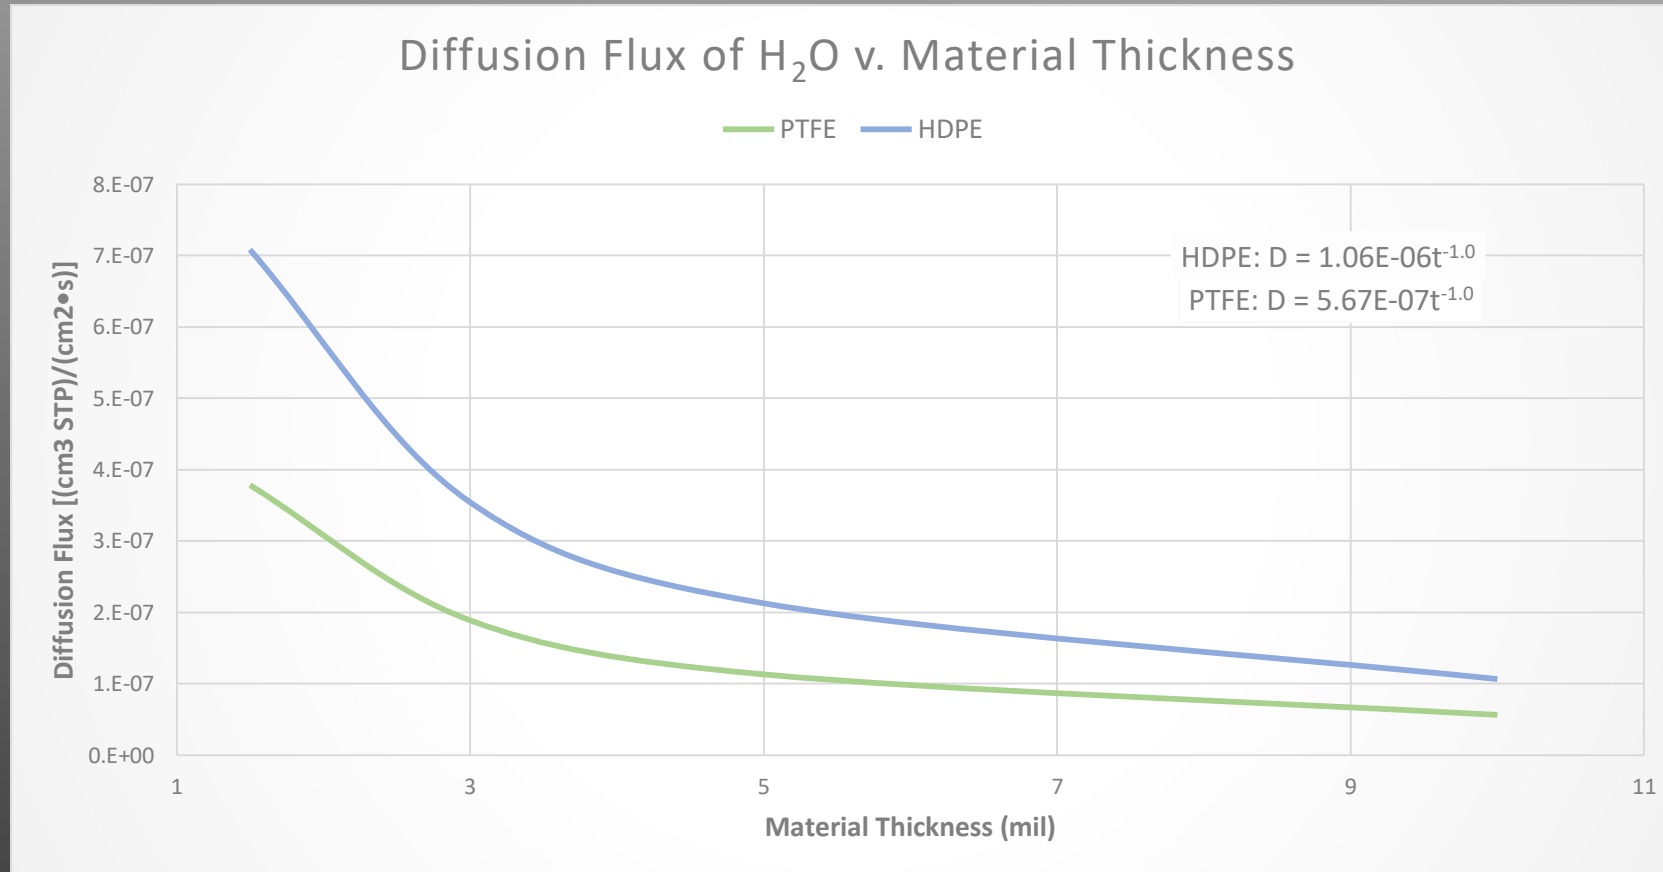

Figure 22. Except of permeability analysis conduct on various fabric materials

# HEAT TRANSFER ANALYSIS

Figure 23. Temperature trends while ambient air temperature is held constant

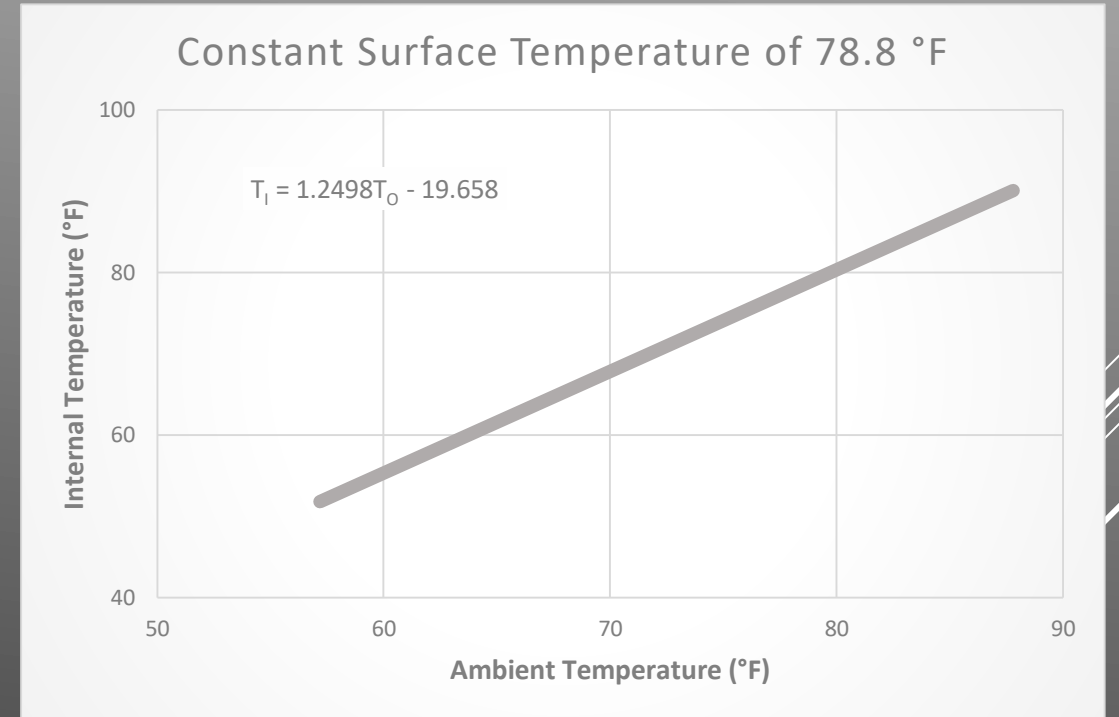

Figure 24. Temperature trends while enclosure surface temperature is held constant

# ***DEGRADATION ANALYSIS***

- ▶ Cut-off wavelength of 180nm [2]
- ▶ Spectral Sensitivity Range of 260nm-360nm [2]
- ▶ Measured a 4.0 for stability [2]
- ▶ Altered PE with UV stabilizer results in HDPE
  - ▶ Approximated lifetime of 20 year [3]

# WIND LOAD ANALYSIS

Figure 25. Wind speeds in & around the enclosure while at a freestream velocity of 50 mph

# ***FLEXURAL STRENGTH ANALYSIS***

- ▶ Double Integration Method:  $\theta(x) = \int \frac{M(x)}{EI} dx$  &  $\Delta = \iint \frac{M(x)}{EI} dx$
- ▶ Fibers will snap prior to major deflection

Figure 26. RISA 3D results of a 3 point bend test with a load of XXX

# STRESS (FOS) ANALYSIS

- ▶ RISA 3D used for getting reaction forces
- ▶ Reaction forces used to calculate shear and bearing stress
- ▶ Ultimate shear and tensile strength used to get factor of safety

Table 5. Factor of safety for individual components determined from RISA 3D analysis

| Part                         | Yeild Factor of Safety | Failure Faecture of Safety |
|------------------------------|------------------------|----------------------------|
| Hinge Bolt                   |                        | 15.2                       |
| Hinge Plates                 | 3.56                   | 6                          |
| 5/8" Base Plate Pin          |                        | 3.24                       |
| Base Plates 5/8" Hole        | 2.82                   | 4.75                       |
| Base Adaptor Plate 5/8" Hole | 5.17                   | 8.71                       |
| 3/4" Base Plate Pin          |                        | 4.67                       |
| Base Plates 3/4" Hole        | 3.39                   | 5.7                        |
| Base Adaptor Plate 3/4" Hole | 6.21                   | 10.45                      |

Figure 27. RISA 3D model with distributed loads representing a 50 mph wind load

# DEFLECTION ANALYSIS

- ▶ Risa 2D
- ▶ Construction Materials
  - ▶ Laminated Veneered Wood
  - ▶ Aluminum 6061
  - ▶ 1006 Steel
  - ▶ Carbon Fiber
- ▶ Column Cross-Section
  - ▶ Square rod and tubing
  - ▶ Circular rod and tubing
  - ▶ I-beam
- ▶ Material with least deflection: Carbon Fiber
- ▶ Cross-section with the least deflect: Square Rod

Figure 28. RISA 2D analysis performed to aid in structural material selection

# TEMPERATURE TESTING

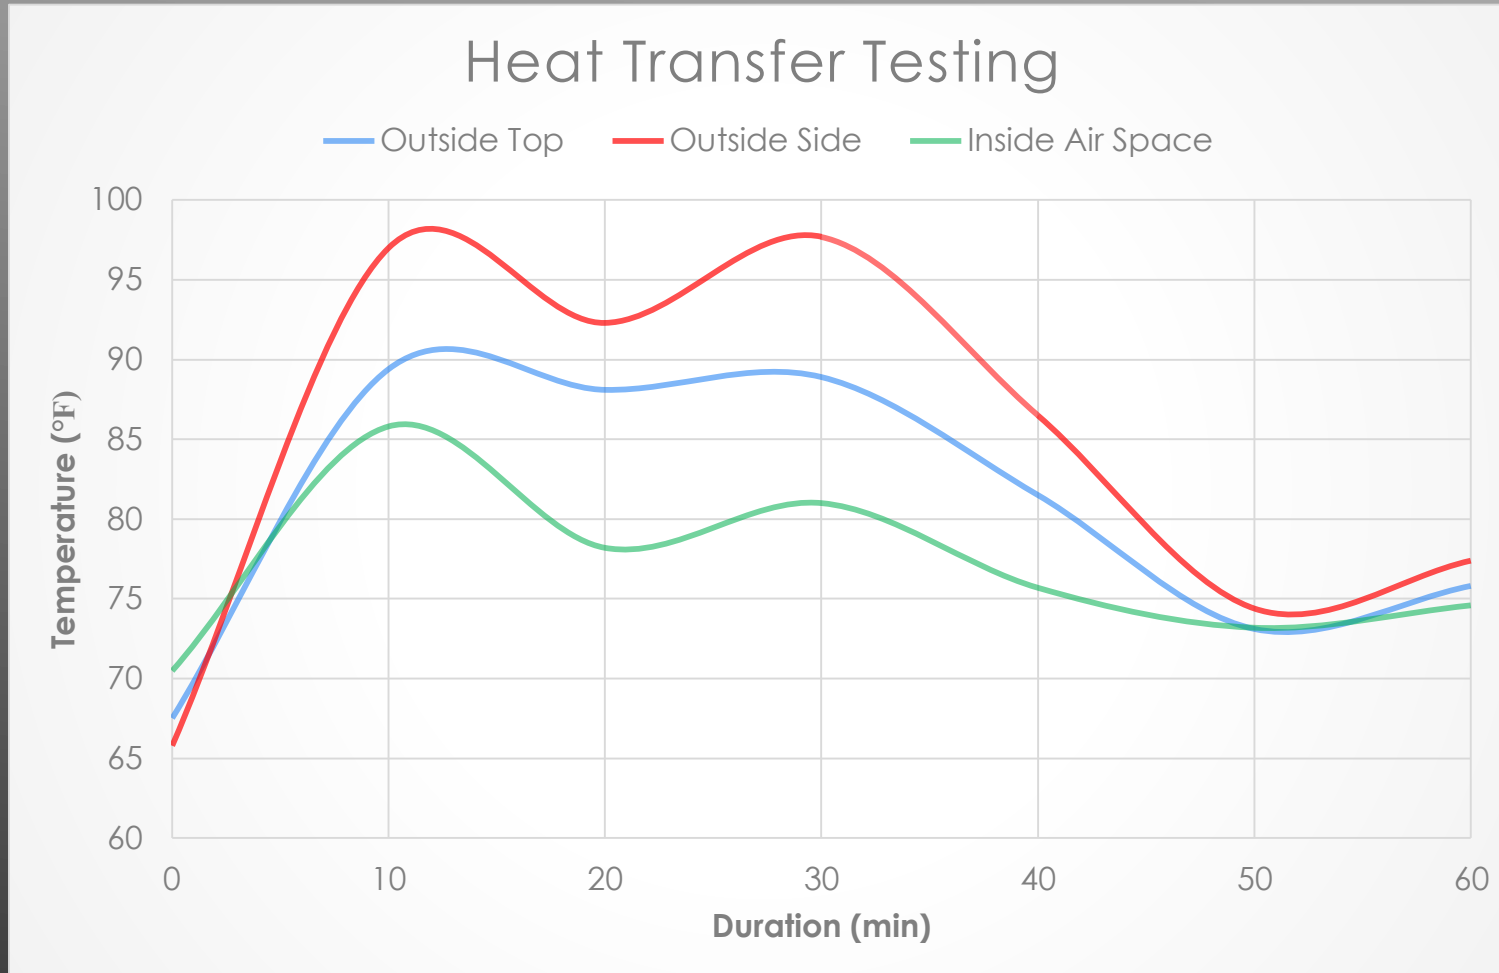

Figure 29. Results of heat transfer testing at three critical locations of the system

# ***FLEXURAL TESTING***

Figure 30. Results from bending tests conducted on high modulus carbon fiber

# DESIGN CHANGES

- ▶ Changes occurred only on the sub-scale prototype
- ▶ Dodecagon replaced semicircle
  - ▶ Top arch
- ▶ Eye bolts replaced pulleys
  - ▶ System deployment
- ▶ Paracord replaced steel cable
  - ▶ System deployment

Figure 31. Visualization of the design changes made from original design to final prototype
