Biomechatronic Hip Exoskeleton Team (BHET)

KEEGAN RAGAN SEAN OVIEDO INNA QUIAMBAO MOHANAD FAKKEH

Project Description

Background

- The NAU Biomechatronics Lab develops and tests robotic exoskeletons that provide powered assistance to the wearer during the walking gait cycle
- Research is focused on improving mobility for individuals with diminished motor function
- Created an exoskeleton for ankle assist

Project Description

Project Goal

 Design an exoskeleton device that applies torque assistance at the hips and measure the torque being delivered. The device will be used to test joint torque assistance needed to reduce the metabolic cost of walking.

Client

- Leah Liebelt
- NAU Biomechatronics Lab

Sponsor

• W.L. Gore & Associates

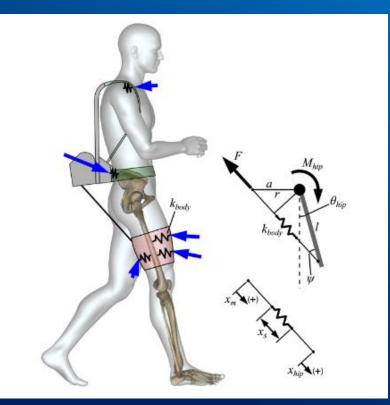

Figure 1: Force diagram of a hip exoskeleton design [1]

Design Description – CAD Model

1. Electric Motor

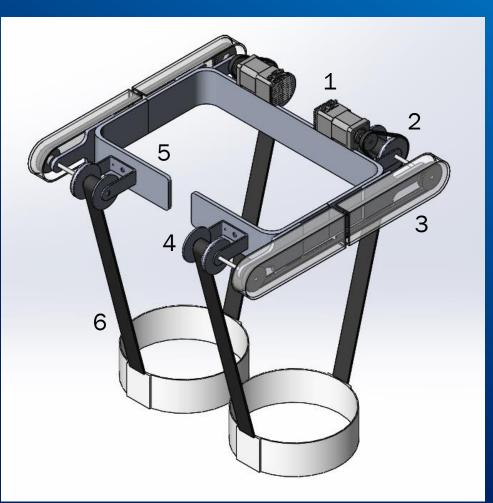

2. Rear Spool

3. Drive Belt with Cover

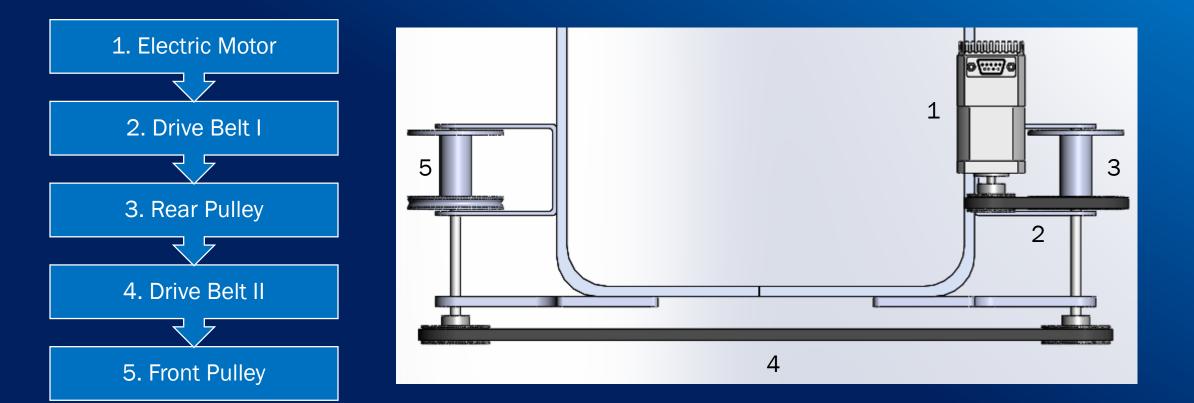

4. Front Spool

5. Rigid Frame

6. Belts with Leg Loops

Design Description – Drive System

Design Requirements

List of customer requirements:

- Hip Actuation
- <u>Full Range of</u> <u>motion</u>
- <u>Sense Torque</u>
- Minimize
 metabolic cost
- Safe to operate
- Untethered

- Durable
- Easy to don and doff
- Comfortable
- Reliable
- Within Budget
- Fit small to medium build

Design Requirements – ER's

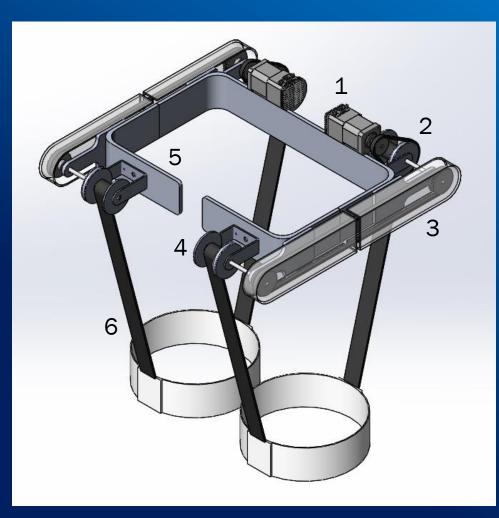

- Torque Applied (^)
- Metabolic cost of walking (V)
- Time to don/doff
- User comfort rating (0-10)
- Weight (V)
- Operation time/cycle (time per test)

 (^)
- Power required

- Cycles to failure
- Cost to manufacture (V)
- Extension/Flexion (^)
- Abduction/Adduction
- Rotation
- Noise (V)
- Compliance/comfortability.

Design Requirements

- How design meets requirements:
 - Design can actuate movement in extension/flexion (2, 4)
 - Able to move freely in other degrees of motion (6)
 - Untethered, run by a motor and battery (1)
 - Able to place sensors on the rigid frame (5)
 - It's easy to don and doff since it is attached to a soft belt

Design Requirements

Why we picked the prototype design:

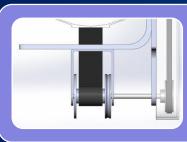

Mass

- Hamstring = 14.53 lbs.
- Belt = 5.89 lbs.
- Prototype = 4.41 lbs.
- The team wants to minimize the mass.

Motors

- Original belt system had four motors
 - Wanted to reduce this
- Prototype has a belt drive which reduces this amount to two motors
- Affects budget and power

Design Validation – Potential Failures

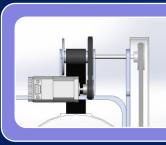

Connection between Rigid Belt and Spools

Frame Deflection during Torque Delivery

Belts Fraying or Failing

Design Validation – Test Procedures

Materials Testing

Frame Components and Spools

- **Frame Deflection Testing**
- FEA Analysis, Test Rig

Tensile Testing on Belts

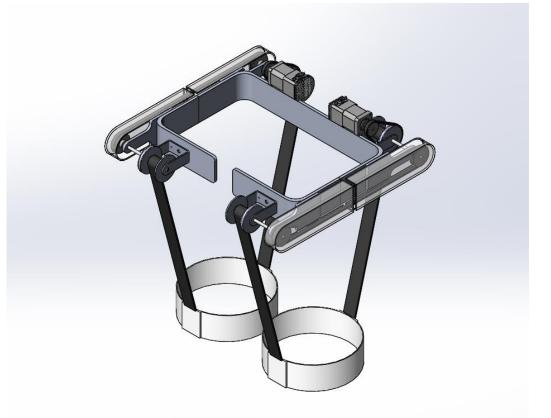

• Lightest weight possible
